

This is what you get to use on test:

**Mechanics Formulas:**

TNEOM:  $V_f = V_i + a\Delta t$   
 $\Delta x = V_i\Delta t + \frac{1}{2}a\Delta t^2$   
 $V_f^2 = V_i^2 + 2a\Delta x$

Weight:  $F_{gravity} = mg$

Gravitation:  $F_g = \frac{G m_1 m_2}{r^2}$

Gravitation constant:  $G = 6.67 \times 10^{-11} \text{ Nm}^2/\text{kg}^2$   
 (just G's units) ↑

Force:  $F = ma$

Friction:  $f = \mu N$

Trig formulas:  $\tan\theta = \text{opp} / \text{adj}$   
 $\sin\theta = \text{opp} / \text{hyp}$   
 $\cos\theta = \text{adj} / \text{hyp}$

Pythagorean Theorem:  $a^2 + b^2 = c^2$

Kinetic energy:  $KE = \frac{1}{2} m v^2$

Potential energy:  $PE = mgh$

Work energy:  $W = Fd \cos\theta$

spring energy:  $E_{sp} = \frac{1}{2} kx^2$

efficiency =  $W_{out} / W_{in} \times 100\%$

power:  $P = \frac{W}{\Delta t} = F v$

momentum:  $p = mv$

impulse:  $I = F\Delta t = m\Delta v$

circular motion:

centripetal velocity:  $v = \frac{2\pi r}{t}$

centripetal acceleration:  $a_c = \frac{v^2}{r}$

**E&M Formulas:**

Coulomb's Law:  $F = \frac{k Q_{source} q_{test}}{r^2}$

Coulomb's constant:  $k = 9.00 \times 10^9 \text{ Nm}^2/\text{C}^2$   
 (just k's units) ↑

Electron charge :  $e = -1.60 \times 10^{-19} \text{ C}$

Electron mass :  $9.11 \times 10^{-31} \text{ kg}$

Proton mass :  $1.67 \times 10^{-27} \text{ kg}$

Electric Field :  $E = \frac{F}{q_{test}}$

(E for point source)  $E = \frac{k Q_{source}}{r^2}$

Potential :  $V = \frac{PE}{q_{test}}$

(V for point source)  $V = \frac{k Q_{source}}{r}$

(V for parallel plates)  $V = E d$

Potential Energy (for Point sources):  $PE = \frac{k Q_{source} q_{test}}{r}$

Ohm's Law:  $V = I R$

Power:  $P = I V$

Series:  $R_{tot} = R_1 + R_2 + \dots$

Parallel:  $1/R_{tot} = 1/R_1 + 1/R_2 + \dots$

Magnetic force:

(for moving charge)  $F = qv \times B$

(for current in wire)  $F = IL \times B$

Induced voltage/emf  $\epsilon = - \frac{N(\Delta\Phi)}{\Delta t}$

## Unit 08 – Vocabulary and Equations – Electrostatics

<b>Vocabulary:</b>	<b>Symbols:</b> F, k, q, d, r, E, e, J, C, PE, V																									
previous vocabulary charge, positive, negative static electricity, current electricity attraction, repulsion proton, neutron, electron conservation of charge fundamental charge, elementary charge, quantized T, G, M, k, c, m, $\mu$ , n (notes 01-01: prefixes and values memorized!) conductor, insulator charging by conduction, charging by induction, ground polarization, fiction charging Coulomb's law, Coulomb's constant, coulomb (C) electrostatic force, electromagnetic force, electrical force field force, contact force electric field, electric field strength, test charge vector, scalar, resultant Triboelectric series electrical potential energy, Joule (J) voltage, Volt (V) electroscope, Tesla coil, Faraday cage, Van de Graaff generator capacitor, Leyden jar	<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 30%;">Equation</th> <th style="width: 15%;">Units</th> <th style="width: 55%;">Notes</th> </tr> </thead> <tbody> <tr style="background-color: #e0e0e0;"> <td><math>F = k \frac{q_1 q_2}{r^2}</math></td> <td>N</td> <td>Coulomb's law. ### Unit Objectives - Williams

1. Particles and interactions (includes methods of charging)
2. Coulomb's law and vector addition of electrostatic forces
3. Electric fields and vector addition of electric fields
4. Potential Energy and electric potentials

### DuPage ROE Objectives

501. I can identify the charge on each sub-atomic particle.
502. I can identify which sub atomic particle moves in a conductor.
503. I can compare and contrast conductors and insulators.
504. I can predict how charges will redistribute based on charging by contact and induction.
505. I can predict attraction and repulsion between charged and neutral objects and the processes that cause them.
506. I can apply Coulomb's Law.
507. I can describe an electric field and identify the electric field diagrams for a one or two charge system.
508. I can identify the direction of the force on a charged object in an electric field.
